The iHorse system presents an innovative solution for the problem of continuous monitoring of equines – inside stables or on the road.

One of the main functionalities of the iHorse system, consists on the possibility of visualizing, in real time, information about the equine (e.g. live video streaming, agitation, cardiac rhythm) as well as the surrounding environment (e.g. temperature and local humidity).

Store/Register: the monitoring operation allows the registration and storage of all the readings for any set of chosen parameters for a specific box/equine.

Mobility: the iHorse system can be used both at the destination where the equine rests, as well as during transport of the equine, and can be accessed via any device with an internet connection.

Alarms: the iHorse system allows realtime configuration of both lower and upper thresholds for all sensors, and automatic triggering of SMS messages to a user's defined set of mobile numbers, everytime those limits are crossed.

The iHorse system provides:

- 24 hours a day, live video streaming, even when used in environments with low or no light sources;
- register (store) and monitor vital and behavioral parameters of the animal, as well as environmental variables;
- access to information via any device with an internet connection;
- multiple boxes/equines monitoring;
- personalized and secure access to information, through the use of different access profiles.

Agitation (IM) | Cardiac Rhythm (BPM)
